

Skillz

From learning to job-ready.

AI-powered personalized job readiness, connecting candidates with real employer requirements.

People learn. Companies hire. The two sides don't line up.

The missing bridge between the two.

Candidates

- Too much learning content, unclear path
- Don't know their real skill gaps
- Certificates don't prove practical ability

Companies

- CVs don't prove competence
- Practical assessment takes real time
- Different companies need different skills

The data backs it up. So did the people we talked to.

63%

of employers see skills gaps as a major barrier to change

40%

of job skills are expected to change by 2030

93%

of recruiters say accurately assessing skills is critical

Source: World Economic Forum, Future of Jobs 2025; LinkedIn, Future of Recruiting 2025.

99

"Experience and demonstrated ability matter more than certificates. We check candidates' actual code."

Nuriddin G'afurjonov — Owner, DevPro

99

"Pet projects and practical assessments show technical knowledge that a CV simply can't."

Karina Rasulova — IT Recruiter

99

"A job-ready candidate can solve a real task, explain their decisions, and fix their own mistakes — a certificate alone doesn't prove that."

Ilvira Rakhmatullaeva — HR, extensive recruiting experience

Interview findings from our own conversations — not a statistically representative study.

Skillz turns employer requirements into a personalized path.

Not the same course for everyone — the shortest useful path from where a candidate is to what the job needs.

— HOW IT WORKS

One example: Junior Python Developer at Company X.

Company X requires

- ✓ Python
- ✓ SQL
- ✓ Django
- ✗ REST APIs

Primary gap: REST APIs

Gemini generates targeted material

Explanation · examples · practice tasks · coding exercises — targeted at this candidate's specific mistakes, not the whole topic.

REST API competency

Before: 42%

→

After practice: 86%

Illustrative numbers for this example — not measured results.

— ASSESSMENT IS RUBRIC-BASED, NOT A VIBE CHECK

- HTTP methods
- Status codes
- Endpoint design
- Request/response
- Error handling

Companies define “job-ready.” Candidates prove it.

Company side

- Role + required competencies + tech stack
- Dashboard: view, filter, compare candidates
- See demonstrated skills and remaining gaps

Confidential company data (credentials, internal docs) never reaches learning content — only generalized, safe competencies do.

Candidate side

- Profile: experience, projects, transferable skills
- Assessment results and current competency gaps
- Personalized learning + practice, target roles

Not just students. Students, junior devs, career switchers, self-taught developers — Skillz looks for transferable skills, not just a degree.

— WHAT WE BUILT

The MVP, end to end, for one role.

- ✓ Company role profile
- ✓ Competency framework
- ✓ Candidate profile
- ✓ Practical assessment
- ✓ Competency evaluation
- ✓ Skill-gap detection
- ✓ AI-generated learning
- ✓ AI-generated practice
- ✓ Reassessment
- ✓ Candidate dashboard
- ✓ Company filtering
- ✓ Confidential data separation

— ARCHITECTURE

Knowledge source: official documentation and public competency frameworks — Gemini is grounded in these, not treated as an unlimited source of truth.

— WHY SKILLZ IS DIFFERENT

We're not replacing these. We connect them.

Learning

Coursera, Udemy, LinkedIn Learning

Skills / workforce dev

Degreed

Hiring

LinkedIn, Indeed, ATS platforms

Existing tools focus on learning, workforce development, or hiring — separately. Skillz connects employer requirements, candidate assessment, skill-gap detection, personalized learning, and reassessment into one loop that ends with proof, not just a course completion.

Platforms like Degreed already do skills, requirements, and personalized development. Our early difference is being candidate-first and hiring-outcome-oriented.

Free for candidates to start. Companies pay when hiring works.

Candidates — freemium

Free: basic assessment, limited AI learning and practice, basic profile

Paid — hypothesis: ~49,000 UZS/month

Expanded learning, more practice, reassessment, more role preparation.

Pricing is a hypothesis to validate through willingness-to-pay research — not a set price.

Companies — success fee

Pay only after a hire completes an agreed trial period. No successful hire, no fee.

Success fee = first-year salary × rate

Standard	8%
Specialized	10%
Hard-to-fill	12%

Illustrative rates — not claimed as market standard. Traditional recruiters often charge more.

A lean cost model, and what break-even could look like.

Planning assumptions for a lean team — not current expenses.

~\$87,000 / year

~\$7,250 / month total operating cost

Sum of the line items on the left.

Break-even scenario

$\$87,000 \div \$900 \text{ avg. hire revenue} \approx 97 \text{ hires/yr} (\approx 8/\text{month})$

Upside scenario: $2,000 \text{ paying candidates} \times \$5/\text{mo} \approx \$120,000/\text{yr}$ in recurring subscription revenue.

— MARKET & SCALABILITY

Start narrow in Uzbek tech. Expand role by role.

3,200

IT Park resident companies, employing 14,000+ specialists (Oct 2025).

Evidence of a growing local tech ecosystem — not our current customer base.

Beachhead

- IT students & junior developers
- Career switchers
- Tech companies hiring entry-level talent

— ONE INFRASTRUCTURE, MANY ROLES

Same pattern each time: competency definitions, assessment rubrics, safe knowledge sources, role requirements.

AI supports the decision. People make the decision.

Responsible AI

- Rubric-based evaluation, not a black box
- Confidential company data never enters learning content
- Consent required before sharing candidate data
- Assessment results stay auditable
- Companies make the final hiring decision — not the AI

Social impact

- Clearer learning paths, less wasted study time
- Practical ability visible, not just credentials
- Structured support for career switchers
- Less wasted time on both sides of hiring
- Opportunity for people without traditional credentials

Where we are, and where this goes.

NOW

One role, one company profile, the core loop working end to end.

NEXT

More roles, more companies, better rubrics, real employer pilots.

LATER

More industries, employer analytics, outcome-based validation.

The future of hiring shouldn't start with a CV.

It should start with: What does this job need? → What can this person show? → What's missing? → Can we close it? → Are they ready?

Skillz turns learning into measurable job readiness.
